Title:

Job Connect: A Platform for Career Recommendations.

Scope:

The platform can serve job seekers, professionals looking to upgrade skills, students, or people transitioning to a new field.

Objective:

Job Connect bridges the gap between employers and job seekers by offering personalized job and candidate recommendations based on education, experience, skills, and interests. It efficiently matches job seekers with relevant roles and helps employers find candidates who meet specific requirements, streamlining the hiring process for both parties

Problem Statement and Description:

In today's competitive job market, job seekers and employers face challenges in finding the right fit. Job seekers often struggle to discover opportunities that match their qualifications and skills, while employers spend considerable time filtering through unsuitable candidates. Current job portals provide broad listings without personalized guidance, leading to inefficiencies in the job search and hiring processes. This results in job seekers being overwhelmed with irrelevant opportunities and employers unable to find qualified candidates quickly.

Job Connect addresses this problem by offering a platform where users take a tailored MCQ test to determine their field of expertise. Based on the test results, the app recommends relevant educational courses to enhance the user's skills and align them with appropriate job opportunities. This approach simplifies the job search

process by helping users focus on the right career path and upskill effectively. The feasibility of the project is high, relying on structured tests and course recommendations, ensuring a practical solution.
